Standard Colour Range

Paintline Process
Ovens are pre-heated in order to bring their surface of the sheet to temperatures of 60/70°C. A waterproof coating is then sprayed on the lower side of the sheet (i.e. at 130-150g/m²). Sheets are heated further in order to bring their temperature to 80/90°C. The acrylic glazing of the sheet is cleaned with brushes for a uniform distribution of colour. Sheets are then kept in a refrigerating tunnel to bring the temperature down to 23/25°C. Finally the sheets are stacked on pallets and wrapped.

Meadowscape Colour Range

The Meadowscape range is available in 3 natural variations of colour, with a matt non BS colour finish that will blend over time into the rural landscape. The matt surface finish reduces sun glare and reflection which is crucial for many planning application approvals. Meadowscape is available in the full range of EUROSIX sheet lengths and fittings.

Other colours are available, please enquire for further information.
